Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin. N-PSDB; AAV30580

Example 35; Page 300-302; 428pp; English.

This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (Eklund 17B strain) type B toxin, encoded by a DNA sequence (see AAV30580) in plasmid phisBotb. This vector was used to express soluble C fragment in Escherichia coli host cells, and the recombinant C fragment was purified on an affinity column. The invention relates to recombinant proteins derived from C. botulinum toxins. Methods proteins free of significant endotoxin contemination. Preferred hosts production of recombinant proteins are E. coli, insect cells and yeast cells. The recombinant tase used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin

Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.

Example 35; Page 303-305; 428pp; English.

This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (Danish strain) type B toxin, encoded by a DNA sequence (see AAY30581) in plasmid pETHisb. This vector was used to express soluble C fragment in Bscherichia coli host cells, and the recombinant C fragment in Bscherichia coli host cells, and the recombinant C reagment proteins derived from C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins derived from C. botulinum toxins. Methods proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunosens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin

This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (Belgua strain) type E neurotoxin, encoded by a DNA sequence (see AAV30584) in plasmid pETHisb: This vector is used to express BotE soluble C fragment in Bscherichia coli host cells, and the recombinant C fragment in Bscherichia coli host cells, and the relates to recombinant proteins derived from C. botulinum toxins, especially type B and type E toxins Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin
                                                                                                                                                                                                                   Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |--|

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the amino acid sequence of the type B toxin of Clostridium botulinum Danish strain. The C fragment (see AAM68393-94) of the serotype B toxin has been expressed as a histidine-raged protein in Escherichia coli. The invention relates to C. botulinum recombinant toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contemination. Preferred hosts for production of the recombinant proteins are E. coli, insect cells and yeast cells. The recombinant proteins are used as immunogens for the production of waccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                       Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.

This is the amino acid sequence of a histidine-tagged fragment C polypeptide of Clostridium botulinum serotype A toxin encoded by a DNA sequence (see AAV30576) in plasmid p6HisBot (syn). This vector was used to express native soluble C fragment in Escherichia coli host cells, with the recombinant C fragment being purified on a poly-histidine binding affinity resin. The invention relates to recombinant proteins derived from C. botulinum roxins. Methods are provided which allow the isolation of soluble recombinant proteins that are free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with
                                                Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW68391 Length: 445 August 31, 2004 14:39 Type: P Check: 9134 Found using 'seq23' (hayes346.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW68392;
```

botulism

```
This is the amino acid sequence of a histidine-tagged fragment C by Dypeptide of Clostridium botulinum serotype A toxin encoded by a DNA sequence (see AAV30572) in plasmid phisBot, and by a DNA sequence (see AAV30575) in plasmid phisBot, and by a DNA sequence (see AAV30575) in plasmid bisBot.

AAV30575) in plasmont being burillad on a poly-histidine binding recombinant C fragment being purified on a poly-histidine binding affinity resin. The invention relates to recombinant proteins derived from C botulinum toxins. Methods are provided which allow the isolation of soluble recombinant proteins that are free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. coli, insect cells and yeast cells. The recombinant toxins are used as in the treatment of humans and animals at risk of intoxication with clostridial toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antitoxin; vaccine; neurotoxin; toxin A; intoxication; immunogen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence of Clostridium botulinum serotype A toxin C-fragment expressed by a DNA sequence (see AAV30571) in plasmid pAlterBot. Recombinant C-fragment proteins have been produced in Escherichia coli as fusion proteins with either maltose binding protein or Clostridium difficile type A toxin (see AAW88387). The invention or Clostridium difficile type A toxin (see AAW8387). The invention are provided which allow for the isolation of soluble recombinant toxin proteins free of significant endotoxin contamination. Preferred hosts for production of the recombinant proteins are E. coli, insect cells and yeast cells. The recombinant toxin proteins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nt of humans and animals at risk of intoxication with clostridial (Updated on 17-0CT-2003 to standardise OS field)

The present sequence represents a recombinant neurotoxin protein from the present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more veeicle or plasma-membrane associated proteins essential to exocytosis, and where the second domain is adapted:

(a) to translocate the protein into a cell; (b) to increase the solubility of the protein into a cell; (b) to increase the colubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein being free of clostridial neurotoxin (CN) and free of CN precursor that can be converted into toxin by proteins can be used as therapeutic agents for targeting cells expressing a relevant substrate. The products can also be used as immunogens and as non-toxic standards for the substrate of the functional botulinum or tetanus neurotoxins either in foodstuffs or in environmental samples

The present sequence represents a recombinant neurotoxin protein from the present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more vesicle or plasma membrane associated proteins essential to exocytosis, and where the second domain is adapted:

(a) to translocate the protein into a cell; (b) to increase the solubility of the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the protein being free of clostridial neurotoxin (CN) and free of CN precursor that can be converted into toxin by proteolytic action. The recombinant proteins can be used as therapeutic agents for targeting cells expressing a relevant substrate. The products can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of functional botulinum or tetanus neurotoxins either in foodstuffs or in Recombinant neurotoxin polypeptides - used to develop therapeutic agents, immunogens or as non-toxic standards for the detection of neurotoxins. | -- | LYTFGGQDPSIITPSTDKSIYDKVLQNFRGIVDRLNKVLVCISDPNININIYKNKFKDKY 289 AAW56017 Length: 1169 August 31, 2004 14:39 Type: P Check: 8491 Found using 'seq23' (hayes346.key)  $\begin{array}{l} |--| \\ \end{array}$  NEIYTIEEGFNISDKDMEKEYRGQNKAINKQAYEEISKEHLAVYKIQMCKSVKAPGICID \\ 421 \\ \end{array} VYEKQPAIKKIFTDENTIFQYLYSQTFPLDIRDISLTSSFDDALLFSNKVYSFFSMDYIK 570 MPVTINNFNYNDPIDNNNIIMMEPPFARGTGRYYKAFKITDRIWIIPERYTFGYKPEDFN ERKKGIFANLIIFGPGPVLNENETIDIGIQNHFASREGFGGIMQMKFCPEYVSVFNNVQE NKGASIFNRRGYFSDPALILMHELIHVLHGLYGIKVDDLPIVPNEKKFFMQSTDAIQAEE ---| KFVEDSEGKYSIDVESFDKLYKSLMFGFTETNIAENYKIKTRASYFSDSLPPVKIKNLLD (MICR-) MICROBIOLOGICAL RES AUTHORITY. The present sequence represents a recombinant neurotoxin protein from the present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more vesicle or plasma-membrane associated proteins essential to exocytosis, and where the second domain is adapted:

(a) to translocate the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the first domain on its own, the protein being free of clostridial neurotoxin (CN) and free of CN precursor that can be converted into toxin by proteolytic action. The recombinant proteins can be used as therapeutic agents for targeting cells expressing a relevant substrate. The products
                                                                                                                                          Recombinant neurotoxin polypeptides - used to develop therapeutic agents, immunogens or as non-toxic standards for the detection of neurotoxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of functional botulinum or tetanus neurotoxins either in foodstuffs or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |--|

Novel modified neurotoxin comprising structural modification which alters the biological persistence and/or biological activity of a neurotoxin, useful for treating neuromuscular or autonomic disorder, or pain.

Example 14; Fig 3; 102pp; English

The sequence represents the botulinum toxin type A HallA light chain. The invention relates to a novel modified neurotoxin including a structural modification is effective to alter the biological persistence, or biological activity. The modified neurotoxin is useful for treating spasmodic dysphonia, laryngeal dystonia, oromandibular dysphonia, lingual dystonia, cervical dystonia, focal hand dystonia, blepharospasm, strabismus, hemifacial spasm, eyelid disorder, cerebral palsy, focal spasticity, spasmodic colitis, neurogenic bladder, anismus, limb spasticity, tics, tremors, bruxism, anal fissure, achalasia, dysphagia, lacrimation, hyperhydrosis, excessive salivation, excessive gastrointestinal secretions, pain from muscle spasms, headache pain, brow furrows or skin wrinkles

Novel modified neurotoxin comprising structural modification which alters the biological persistence and/or biological activity of a neurotoxin, useful for treating neuromuscular or autonomic disorder, or pain.

```
immunogenic derivative of Clostridium botulinum type D toxin (BoNT).

Botulinum neurotoxin causes botulism poisoning in cattle and sheep, and usually results in the death of the affected or poisoned animal. The non-toxic immunogenic fragments of the C. botulinum neurotoxin are useful in vaccines to protect animals (e.g. humans, cattle, sheep, pigs) against simply and inexpensively (specifically by fermentation techniques). As the fragments are not toxic the risk to produced relatively the fragments are not toxic the risk to production staff is reduced.
                                                                                                                                                                                                                                                                                                                                                           Non-toxic immunogenic derivative of Clostridium botulinum neurotoxin type D, useful in vaccines for protection against botulism, comprises at least one amino acid mutation not present in the wild type D neurotoxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence represents the amino acid sequence of a synthetic non-toxic

The sequence represents a leucine based motif from Clostridium botulinum, botulinum toxin type A, which may act as a biological persistence enhancing component in a neurotoxin. The invention relates to a novel modified neurotoxin including a structural modification, where the structural modification is effective to alter the biological persistence, or biological activity. The modified neurotoxin is useful for treating spasmodic dysphonia, laryngeal dystonia, cormandibular dysphonia, lingual dystonia, cervical dystonia, focal hand dystonia, blepharospasm, strabismus, hemifacial spasm, eyelid disorder, cerebral palsy, focal spasticity, spasmodic colitis, neurogenic bladder, anismus, limb lacrimation, hyperhydrosis, bruxism, anal fissure, achalasia, dysphagia, lacrimation, hyperhydrosis, excessive salivation, excessive gastrointestinal secretions, pain from muscle spasms, headache pain, brow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel modified neurotoxin comprising structural modification which alters the biological persistence and/or biological activity of a neurotoxin, useful for treating neuromuscular or autonomic disorder, or pain.
                                                                                                                                                                                           Neurotoxin; biological persistence; dysphonia; strabismus; muscle spasm; dystonia; pain; blepharospasm; hemifacial spasm; excessive salivation; eyelid disorder; cerebral palsy; focal spasticity; spasmodic colitis; neurogenic bladder; anismus; limb spasticity; tic; tremor; bruxism; anal fissure; achalasia; dysphagia; lacrimation; hyperhydrosis; headache; excessive gastrointestinal secretion; leucine-based motif; botulinum.
                                                                                                                                                             Clostridium botulinum botulinum toxin type A leucine based motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Check: 2137

The sequence represents a mutant of the botulinum toxin type A HallA

light chain, in which the leucine residues at positions 427 and 428 have

been substituted by alanine. The invention relates to a novel modified

conditioation is effective to alter the biological persistence, or

modification is effective to alter the biological persistence, or

biological activity. The modified neurotoxin is useful for treating

spasmodic dysphonia, laryngeal dystonia, oromandibular dysphonia, lingual

cystonia, cervical dystonia, focal hand dystonia, blepharospasm,

spasmodic colitis, neurogenic bladder, cerebral palsy, focal

spasticity, spasmodic colitis, neurogenic bladder, anismus, limb

spasticity, tics, tremors, bruxism, anal fissure, achalasia, dysphagia,

lacimation, hyperbytoxis, excessive salivation, excessive

dastrointestinal secretions, pain from muscle spasms, headache pain, brow

turrows or skin wrinkles. Note: The present sequence is not shown in the

specification but is derived from the sequence information given in Figure 3 and on page

Sequence 437 AA;

Neurotoxin; biological persistence, dysphonia; strabismus; muscle spasm; dystonia; pain; blepharospasm; hemifacial spasm; excessive salivation; estild disorder; cerebral palsy; focal spasticity; spasmodic colitis; neurogenic bladder; anismus; limb spasticity; tic; tremor; bruxism; anal fissure; achalasia; dysphagia; lacrimation; hyperhydrosis; headache; excessive gastrointestinal secretion; botulinum toxin type A; HallA;
                           The sequence represents the botulinum toxin type B Danish I light chain. The invention relates to a novel modified neurotoxin including a structural modification, where the structural modification is effective to alter the biological persistence, or biological activity. The modified neurotoxin is useful for treating spasmodic dysphonia, laryngeal dystonia, oromandibular dysphonia, lingual dystonia, certoial dystenia, focal hand dystonia, bepharospasm, strabismus, hemifacial spasm, eyelid disorder, cerebral palsy, focal spasticity, spasmodic colitis, neurogenic bladder, anismus, limb spasticity, tics, tremors, bruxism, anal fissure, achalasia, dysphagia, lacrimation, hyperhydrosis, excessive salivation, excessive gastrointestinal secretions, pain from muscle spasms, headache pain, brow furrows or skin wrinkles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          abb80655; Botulinum toxin type A HallA light chain dell-8/416-437 mutant. The sequence represents a mutant of the botulinum toxin type A HallA

CC light chain, in which the 8 amino acids at the N-terminus and 22 amino
acids at the C-terminus have been deleted. The invention relates to a
novel modified neurotoxin including a structural modification, where the

CC or biological activity. The modified neurotoxin is useful for treating

CC spasmodic dysphonia, laryngeal dystomia, oromandibular dysphonia, lingual

CC spasmodic dysphonia, laryngeal dystomia, oromandibular dysphonia, lingual

CC strabismus, hemifacial spasm, eyelid disorder, cerebral palsy, focal

Spasticity, spasmodic colitis, neurogenic bladder, anismus, limb

CS spasticity, tics, tremors, bruxism, anal issure, achalasia, dysphagia,

C actimation, hyperhydrosis, excessive salivation, excessive

C astronitestimal secretions, pain from muscle spasms, headech pain, brow

C furrows or skin wrinkles. Note: The present sequence is not shown in the

Specification but is derived from the sequence information given in

Figure 3 and on page 69
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |--|

```
terminus, and a cysteine, serine or threonine at its N-terminus, and a uncleophilic reagent able to cause cleavage of the intein to form a peptide bond between the extein C-terminus and synthetic peptide N-terminus through the formation of an activated ester or thio ester intermediate. (1) has antiinflammatory activity and prevents accumulation of pancreatic digestive enzymes, and prevents exceptic fusion of vesicles containing secretory enzymes of pancreas. (1) is useful for treating bottlinum BoNT/A neurotoxin light chain prototoxin which is given in the exemplification of the present invention

The present invention describes a composition (1) for treating acute pancreatitis. (1) comprises a first element containing a binding element that binds to a pancreatic cell surface marker, a second element containing a translocation element that facilitates polypeptide transfer across the vesicular membrane, and a third element containing a cross the vesicular membrane, and a third element containing a cross the vesicular membrane, and a third element containing a cross the vesicular membrane, and a third element containing a therapeutic cell cytoplasm. Also described is a method for making a therapeutic cell cytoplasm. Also described is a method for making a therapeutic cell cytoplasm expressing within a host cell a recombinant chimeric polypeptide comprising an extein containing a therapeutic element and a translocational element, and an intein located to the carboxy terminal of contacting the extein with a synthetic peptide comprising a CCK amino acid sequence containing an amidated phenylalanine at a natural C-terminus, and a cysteine, serine or threonine at a natural C-terminus, and a cysteine, serine or threonine at a natural C-terminus, and a cysteine, serine or threonine at a natural C-terminus, and contacting the extein of the cause cleavage of the intein to form a nucleophilic reagent able to cause cleavage of the intein to form a nucleophilic reagent the extein C-terminus and synthetic peptide N-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       terminus through the formation of an activated ester or this ester intermediate. (1) has antiinflammatory activity and prevents accumulation of pancreatic digestive enzymes, and prevents exceptic fusion of vesicles containing secretory enzymes of pancreas. (1) is useful for treating acute pancreatitis. The present sequence represents the Clostridium bothlinum BoNT/A prototoxin heavy chain C-terminal neural cell binding domain, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                           procholecystokinin; CCK A receptor; CCK B receptor; pancreatitis;

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     24 matches found in sequence:
aae07900 , C. botulinum C2 translocation domain with BONT/F-binding domain #1.

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a disulfide beavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need production yield from the genefically engineered production.

Production yield from the genefically engineered product is also high and content of the production is lower. The nucleic acids can be derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine against botulism.
                                                                                                Botulism; toxin; neurotoxin; heavy chain; recombinant expression; recombinant vector; antigen; immune response; vaccine; bacterium;
                                                                 Botulism toxin heavy chain C-terminal sequence (serotype F).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ξ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Lapenotiere

against botulism.

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a condition heavy chain and a 50 kDa light chain which remain linked by a displaid bond. Nucleic acids encoding the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichla pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium.

Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from

```
The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BoNTA-BoNTG): The vaccine of the invention is novel recombinant. DNA construct comprising a vector, and at least one nucleic acid fragment to DNA construct comprising a Vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-G. In preferred embodiments of the invention, the vector is a Venezuelan equine encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 cserotypes are represented in the formulation. The novel vaccine of large quantities. It is also expressed in the lymph nodes for a better immine resonnes damences analyzing recogness these problems, as it is easily purified, and available in immine resonnes.
                                                                                                                                                                                                                                                                                                                                                                            Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A-G, is used for inducing an immune response against

immune response. Sequences AA777134-Y77139 represent synthetic BoNT HC fragments used in the present invention. The DNA encoding these sequences had been optimized for codon usage for expression in yeast. Note: This sequence is not given in the specification, but is decoded from the BoNTB HC DNA sequence given on pages 39-40

Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A-G, is used for inducing an immune response against botulinum

Claim 24; Page 41-42; 54pp; English.

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, B, F and G (BONTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (Ho) from BoNT serotypes A-G. In preferred embodiments of the invention, the vector is a Venezuelan equine encephalitis virus (VEB) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host calls can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for

```
botulinum toxins in food and are also useful in health care and in military applications. They are less expensive to produce than monoclonal antibodies as they can be isolated from large scale bacterial cultures. Also, the affinity of an rFab may be altered by mutagenesis of its gene and subsequent screening of the expressed rFabs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      13 matches found in sequence:

equine encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein enceded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. Sequences AAY7134-Y77139 represent synthetic BoNT HC fragments used in the present invention. The DNA encoding these sequences had been optimised for codon usage for expression in yeast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14 matches found in sequence:

```

Clostridium botulinum.

```
transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurocoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ) matches found in sequence: aabodogs; betulism toxin heavy chain N-terminal sequence (serotype C). Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then postranslationally nicked, forming a dichain consisting of a model then postranslationally nicked, forming a dichain consisting of a clasuifide bond. Wucleic acids encoding the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant or combinant nucleic acids are advantageous since it eliminates the need confirmed acids are advantageous since it eliminates the need confirming the production of hazardous toxin-producing bacterium.

Production yield from the genetically engineered product is also high and clostridium botulinum serotypes A-G
                                                                                                                                              New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              matches found in sequence:
aab04099; Botulism toxin heavy chain N-terminal sequence (serotype D).

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in HC) or aminoternasformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulingm. The nucleic acids are expressible in a recombinant corganisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from 1099 Length: 386 August 31, 2004 14:39 Type: P Check: 4483 using 'seq23' (hayes346.key) Clostridium botulinum serotypes A-G Sequence 386 AA; AAB04099

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a constitution of the constitution of the constitution of the neavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino cerminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant companism such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium.

Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
                                                                                                                                                                                ·

Detection of botulinium toxin.

Claim 15; Col 31-34; 24pp; English.

This sequence represents the light chain of BotFab 20, a murine recombinant antibody fragment (rFab) specific to botulinum toxin types A and B. A DNNA library was made from mouse mRNA isolated from mice immunised with human pentavalent toxoid. The cloned mouse heavy and light chains were expressed in phage display libraries and screened for their ability to bind to botulinum toxin types A or B. The clones were then 

antigenically distinct serotypes (A-G) and is non-covalently associated with non-neurotoxic proteins. The rrab of this invention binds to the non-neurotoxic proteins that are found in neurotoxin complexes A and B. Such antibody fragments are able to act as immunosensors for detecting botulinum toxins in food and are also useful in health care and in military applications. They are less expensive to produce than monoclonal antibodies as they can be isolated from large scale bacterial cultures. Also, the affinity of an rrab may be altered by mutagenesis of its gene and subsequent screening of the expressed rFabs several isolated and sequenced. Botulinum neurotoxin is produced as 88888888888888

This sequence represents the heavy chain of BotFab 22, a murine recombinant antibody fragment (rFab) specific to botulinum toxin types A and B. A DNNA library was made from mouse mRNA isolated from mice immunised with human pentavalent toxid. The cloned mouse heavy and light chains were expressed in phage display libraries and screened for their ability to bind to botulinum toxin types A or B. The clones were then isolated and sequenced. Botulinum neurotoxin is produced as several antigenically distinct serotypes (A-G) and is non-covalently associated with non-neurotoxic proteins. The rFab of this invention binds to the non-neurotoxic proteins that are found in neurotoxin complexes A and B. Such antibody fragments are able to act as immunosensors for detecting
with non-neurotoxic proteins. The rFab of this invention binds to the non-neurotoxic proteins that are found in neurotoxin complexes A and B. Such antibody fragments are able to act as immunosensors for detecting botulinum toxins in food and are also useful in health care and in military applications. They are less expensive to produce than monoclonal antibodies as they can be isolated from large scale bacterial cultures. Also, the affinity of an rFab may be altered by mutagenesis of its gene and subsequent screening of the expressed rFabs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2 matches found in sequence: aay30123; Murine anti-botulinum toxin antibody fragment (BotFab 22) heavy cha (from "bt_ags.pep")

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a clook ba heavy chain and a 50 kDa light chain which remain linked by a clisulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) and be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant or organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |--| |--|

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then postranslationally nicked, forming a dichain consisting of a condition heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antipans useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need or culture large quantities of hazardous toxin-producing bacterium.

Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from the genetically engineered product is also high and cost of cost of production are acond production and the genetically engineered product is also high and cost of production botulinum serotypes A-G

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a disulfide boat chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in immune response to give produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing batterium.

Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
                                                                                                                                                                                                                                                                                                                                                                                               Botulism; toxin; neurotoxin; heavy chain; recombinant expression; recombinant vector; antigen; immune response; vaccine; bacterium;

Clostridium botulinum.

infection. Synthetic. WO200067700-A2.

16-NOV-2000

Botulism toxin heavy chain C-terminal sequence (serotype A).

11-APR-2001 (first entry)

```
Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a low kDa heavy chain and a 50 kDa light chain which remain linked by a distulbide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corganisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need conduction yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
                     New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine

AAB04088 standard; protein; 437 AA.

AAB04088; RXB

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurocoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of encombinant nucleic acids are advantageous since it eliminates the need New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. ```
transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need
                                                                                                                                                                                                              to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from clostridium botulinum serotypes A-G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      :
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13 matches found in sequence:
    aab04090 ; Botulism toxin heavy chain C-terminal sequence (serotype A)
    (from "bt_ags.pep")

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a display be bond. Nucleic acids encoding the carboxy-terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corpanisms such as Eschericina coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium.

Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
                                                                                                                                                                                                                                                                                                        New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine against botulism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    73.76

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal linked by a minoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acids encoding the carboxy- or amino-terminal portions of theavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine

New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine against botulism.

English. Claim 3; Fig 5b; 73pp; Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a control of the heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corganisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then postranslationally nicked, forming a dichain consisting of a close that heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corpanisms such as Bscherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium.

The coll of production is lower. The nucleic acids can be derived from cost of production is lower. The nucleic acids can be derived from

Middlebrook JL,

Smith LA, Byrne MP,

New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine against botulism. N-PSDB; AAA54488

Claim 3; Fig 7b; 73pp; English.

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a dichain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichai pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium.

```
Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant or companians such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need corputure large quantities of hazardous toxin-producing bacterium.

Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              aab04102 ; Botulism toxin heavy chain N-terminal sequence (serotype G).

```
Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a control heavy chain and a 50 kDa light chain which remain linked by a clisulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium.

The production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAB04102 Length: 410 August 31, 2004 14:39 Type: P Check: 3960 Found using 'seq23' (hayes346.key)

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a displayed bond. Nucleic acids encoding the carboxy terminal (HC) or aminoterminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant or organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium.

Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Check: 8175
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAB04103 Length: 432 August 31, 2004 14:39 Type: P

New nucleic acids encoding the carboxy- or amino-terminal portions of the

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine Check: 8247 AAB04167 Length: 449 August 31, 2004 14:39 Type: P Found using 'seq23' (hayes346.key) Clostridium botulinum serotypes A-G Claim 3; Fig 10b; 73pp; English against botulism

New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.

Example 2; Page 49; 50pp; English.

The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (arrowy terminal half of heavy chain (H) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are cusful for the transment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for delivering therapeutic culting neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with tetanus

The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (arboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN domain of a clostridial toxin. Polypeptides of the invention are a HN domain of a clostridial toxin. Polypeptides of the invention are cosful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for delivering therapeutic cult. The polypeptide constructs are useful for delivering therapeutic substances to neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with tetanus New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells. 20 matches found in sequence:
aae07903 ; C. botulinum C2 translocation domain with TeNT binding domain #2.

Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.

Example 12; Page 57-60; 130pp; English.

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-is surface markers and for inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders treating muscle spasms such as blephorospasm, torticolis and hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (Dip-HN domain) and botulinum type F neurotoxin from Clostridium botulinum. This sequence is used in the exemplification of the invention. (Updated on 23-OCT-2003 to standardise OS field)

Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.

Example 12; Page 60-63; 130pp; English

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a carget cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, promoting or inhibiting cells, promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for cating prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corpubacterium diphtheriae diphtheria toxin translocation domain (DipT-HN domain), botulinum type F neurotoxin binding domain (BONT/F-HC) from Clostridium botulinum and thrombin linker peptide. This sequence is used in the exemplification of the invention

Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.

Example 12; Page 63-65; 130pp; English

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target call. Pharamaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular confliction and regulating nitric oxide release from cells. The invention of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention of cell, for intracellular cell, for intracellular infection, for interfering with intracellular cell, for intracellular from cells. The invention is also useful for trafficking, for modulating expression of cell-eurface markers and for chibiting secretion from cells. The invention is also useful for trafficking prion disease, Alzheimer disease and wide range of disorders including muscle spasms such as blephorospasm, torticols and construct comparising Corynbacters such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct domain (Dipp-HM Gomain), botulinum type F neurocoxin translocation domain (Dipp-HM Gomain), botulinum and factor Xa linker peptide. This sequence is used in the exemplification of the invention

AAE35710 standard; protein; 1192 AA.

AAE35710;

(first entry) 17-JUN-2003 

BoNT/F-Hc-DipT HN domain-thrombin-linker SigD protein fusion construct.

Apoptosis; therapy; inflammatory mediator; intracellular trafficking; infection; Prion disease; Alzheimer' disease; hypersecretion disorder; muscle spasm; CODD; bronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; diphtheria toxin; BONT/F; translocation domain; HN domain; DipT; HC; binding domain; botulinum type F neurotoxin; invasion gene D protein; SigD protein.

Corynebacterium diphtheriae. Clostridium botulinum. Salmonella typhimurium. Unidentified. Chimeric.

05-DEC-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hypersecretion disorders such as chronic obstructive pulmonary disease (CODD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DipT-HN domain), botulinum type F neurotoxin binding domain (BorYFF-H) from Clostridium botulinum and thrombin linker peptide and Salmonella typhimurium truncated invasion gene D protein, sigD. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating an euronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating prion disease, Alzheimer' disease and wide range of disorders including muscle spagms such as blephorospasm, torticolis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAE35710 Length: 1192 August 31, 2004 14:39 Type: P Check: 7092 Found using 'seq23' (hayes346.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |--|

trafficking, for intracellular infection, for interfering with intracellular tracellular cell, for intracellular infection, for interfering with intracellular inhibiting secretion from cells. The invention is also useful for treating secretion from cells. The invention is also useful for including muscle spasms such as blephorospasm, torticolis and including muscle spasms such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corymebacterium diphtheria diphtheria toxin translocation domain (DipT-HN domain), botulinum type F neurotoxin binding domain (BoNI/F-HO from Clostridium botulinum and factor Xa linker peptide and salmonnella typhimurium invasion gene D protein, SigD. This sequence is used in the exemplification of the invention release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell. The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; preventing and reversing damage to cells, killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular Example 12; Page 101-106; 130pp; English

release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell Conjugate for modulating cell survival and cell growth, modulating

Example 12; Page 110-114; 130pp; English.

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells, killing cells, promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for

```
inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and shown such as chronic obstructive pulmonary disease hypersecretion disorders such as chronic obstructive pulmonary disease (CORD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DipT-HN domain), botulinum type F neurocoxin binding domain (SMT/F-HO) from Clostridium botulinum and factor Xa linker peptide and Yersinia pestis targetted effector protien YopT. This sequence is used in the exemplification of the invention

Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.

Example 12; Page 125-127; 130pp; English.

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for trafficking. inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and hypersecretion disorders such as chronic obstructive pulmonary dise (COPD), bronchitis and asthma. The present sequence is Clostridium botulinum C2 toxin component 1. This sequence is used in the exemplification of the invention

neurotoxin (BONT). It was produced by amplifying overlapping fragments of the BONT gene. The amplified fragments were cloned expressed to identify immunogenic polypeptides which are capable of giving rise to protective antibodies. The BONT polypeptide fragment are useful as vaccines, for immunizing against botulism, and as diagnostic agents to identify protective antibodies
                                                                                                                                                                                                            New protective epitopes of neurotoxin of Clostridium botulinum, useful for developing vaccines against neurotoxins of Clostridium botulinum and for identifying protective antibodies.
                                                                                                                                                                                                                                                                                                                                   The present sequence represents a fragment of the Clostridium botulinum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Toxin; neurotoxin; fusion protein; antitoxin; vaccine; immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LNSSLYRGTKFIIKKYASGNKDNIVRNNDRVYINVVKNKEYRLATNASQAGVEKILSAL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a fragment of the Clostridium botulinum neurotoxin (BoNT). It was produced by amplifying overlapping fragments of the BoNT gene. The amplified fragments were cloned expressed to identify immunogenic polypeptides which are capable of giving rise to protective antibodies. The BoNT polypeptide fragment are useful as vaccines, for immunizing against botulism, and as diagnostic agents to identify protective antibodies
                                                                                                                                                                                                                                                                                                                                                 developing vaccines against neurotoxins of Clostridium botulinum and identifying protective antibodies.
                                                                                                                                                                                                                                                                                                                                   protective epitopes of neurotoxin of Clostridium botulinum, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       matches found in sequence:
aag79296; Amino acid sequence of botulinum neurotoxin (BONT) fragment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Clostridium botulinum type A neurotoxin (AAR95010) is processed to form a dimer composed of a light and a heavy chain. It is the product of the type A neurotoxin gene (AAT92944). The 50 kDa C-terminal portion of the heavy chain, or C fragment (see also AAR85008), was produced using a synthetic gene (AAT29245) having codon usage altered to improve expression in Escherichia coll. Fusion proteins of the type A toxin or C fragment, with e.g. maltose binding protein or polyhistidine affinity tag (see also AAR95008), are used to generate neutralising antitoxins and in
                                                      Fusion proteins comprising non-toxin protein and part of toxin - useful to form anti-toxins against Clostridium botulinum type A, and C. difficile type toxins, and to treat C. difficile intoxication, partic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GFEESLEVDTNPLLGAGKFATDPAVTLAHELIHAGHRLYGIAINPNRVFKVNTNAYYEMS

The invention discloses modified botulism toxin (BoTOX) or tetanus toxin (TeTOX) which contain new protease cleavage sites. These sites are created in regions where the cleavage site is specifically susceptible to cleavage by a protease that is present in effective levels only in a tissue where toxicity is undesirable and where the cleavage site itself does not inactivate the toxin. BoTOX and TeTOX are neurotoxins which are highly potent and specific poisons of neural cells. The toxins are highly potent and specific poisons of neural cells. The toxins are synthesised in vivo as single chains, which are not toxic, but become setive when nicked, in a post-translational modification, to form separate light and heavy chains which are linked through a disulphide bond. The modified toxins are useful to treat conditions benefited by cellurospass and hemifacial spass, brain injury, spinal cord injury, stroke, multiple sclerosis and cerebral palsy) by administering the toxins are toxins for their localised production. The advantage of the toxins are that they are deactivated in tissues where toxic activity is undesirable and activated at desired targets. The sequence presented is the closured targets. The sequence presented is the

```
A polypeptide (AAW09014) comprises the heavy chain (amino acids 848-1278) of a type F botulinum neurotoxin (BoNT/F), and can be produced using a synthetic gene (AAT48101) based on the natural gene sequence (AAT48100) for the heavy chain. The polypeptides and its fragments (see also AAW09015-17) lack the light chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, esp as fusion proteins, e.g. with maltose binding protein to facilitate purification. (Updated on 17-0CT-2003 to standardise OS field)

Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 - used to isolate antimicrobial compounds, and in vaccines against S. aureus infection.

Claim 6; Page 408-409; 989pp; English.

The present sequence represents a Staphylococcus aureus protein, that, based on homology with a Clostridium botulinum protein, is believed to be a botolinum neurotoxin type C1 precursor. The DNA sequence was isolated from a library of clones of S. aureus WCHH 29 in Bscherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence to control the expression of Staphylococcal genes. The DNA sequence to control the expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome

Polypeptide complex synthesised by Clostridia - useful in, e.g. producing vaccines for protecting animals against serotype E neurotoxin.

Claim 14; Page 3; 38pp; English

Serotype E botulinum neurotoxin and five neurotoxin associated peptides serotype E botulinum neurotoxin and five neurotoxin associated peptides coff molecular weights 118, 80, 65, 40 and 18 kDa respectively. The present sequence represents a partial sequence of the 65 kDa peptide. Also claimed are: (1) detecting the serotype E neurotoxin complex in biological samples by: (a) contacting with an antibody or polypeptide of the complex, and (b) detecting attibody- or polypeptide of the complex, and (b) detecting attibody- or polypeptide bund polypeptide, indicating the presence of serotype E. neurotoxin sesociated polypeptides, and (3) polypeptides of the five neurotoxin associated polypeptides, and (3) polypeptides of the five neurotoxin associated polypeptides on the complex, or one of the five neurotoxin associated polypeptides. The complex can be used to produce therapeutics for treating diseases resulting from excessive acetylcholine therapeutics for treating diseases resulting from excessive acetylcholine of smooth or skeletal muscle cells and resulting in, e.g. spasmodic contraction of smooth or skeletal muscle cells and resulting in, e.g. spasmodic antial or produce the complex can appear of the continuous of the sphincters of the cardiovascular, gastrointestinal or uninary systems, tradive dyskinesia, profuse sweating, lacrimation or mucous secretion. The complex can also be used to produce therapeutics for treating spasticity occurring secondary to brain ischaemia, traumatic injury of the brain or spinal cord, tension headachies, pain caused by sporting injuries or arthritic contractions. The complex may further be used, within a carrier to prepare vaccines, useful for, e.g. vaccinating within a service B neurotoxin. The polypeptides can be used for testing foodstuff, or diagnosing vertebrate gastrointestinal, blood tissue samples, for infection with serotype B neurotoxin, useful in preventing botulism

The present sequence represents a recombinant neurotoxin protein from the present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more vesicle or plasma-membrane associated proteins essential to exocytosis, and where the second domain is adapted:

(a) to translocate the protein into a cell; (b) to increase the solubility of the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the protein compared to the solubility of the first domain on its own, the protein compared to the solubility of the first domain on its own, the protein pening free of clostridial neurotoxin (CM) and free of CM precursor that can be converted into toxin by proteolytic action. The recombinant proteins can be used as therapeutic agents for targeting cells expressing a relevant substrate. The products can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of functional botuling or tetanus neurotoxins either in foodstuffs or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant neurotoxin polypeptides - used to develop therapeutic agents, immunogens or as non-toxic standards for the detection of neurotoxins.

                                                                                                                                                                                                                                                    615
                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents botulinum neurotoxin type A from the present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more vesicle or plasma-membrane associated proteins essential to exocytosis, and where the second domain is adapted:

If the first domain into a cell; (b) to increase the solubility of the protein one cell; (b) to increase the colubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the protein compared to the solubility of the protein pending free of clostridial neurotoxin (CN) and free of CN precursor that can be converted into toxin by proteolytic action. The recombinant proteins can be used as therapeutic agents for targeting cells expressing a relevant substrate. The products can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of functional botulinum or tetanus neurotoxins either in foodstuffs or in
                                                                                                                                                                                                                                                                                                                Recombinant neurotoxin polypeptides - used to develop therapeutic agents, immunogens or as non-toxic standards for the detection of neurotoxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |--|

is adapted to cleave one or more vesicle or plasma-membrane associated proteins essential to exocytosis, and where the second domain is adapted.

(a) to translocate the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the protein compared to the solubility of the first domain on its own, the protein being free of clostridial neurotoxin (CN) and free of CN precursor that can be converted into toxin by proteolytic action. The recombinant proteins can be used as therapeutic agents for targeting cells expressing a relevant substrate. The products can also be used as immunogens and as non-toxic standards for the sassessment and development of in vitro assays for the detection of functional bouldinm or tetanus neurotoxins either in foodstuffs or in environmental samples \$

The present invention. The present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more vesicle or plasma membrane associated proteins essential to exocytosis, and where the second domain is adapted:

(a) to translocate the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the protein compared to the solubility of the protein compared to the solubility of the protein being free of clostridial neurotoxin (N) and free of CN precursor that can be converted into toxin by proteolytic action. The recombinant proteins can be used as therapeutic agents for targeting calls expressing a relevant substrate. The products can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of the compared to the detection of the products assessment and development of in vitro assays for the detection of the products assessment and development of in vitro assays for the detection of the products assessment and the products are assessment and the products assessment and development of in vitro assays for the detection of the products are assessment and the products assessment and the products are assessment and development of in vitro assays for the detection of the products are assessment and the products and the products are assessment and development of in vitro assays for the detection of the products and the products are assessment and the products are assessment and the products and the products are assessment and development of in vitro assays for the detection of the products and a products and the products and the products are assessment and develop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant neurotoxin polypeptides - used to develop therapeutic agents, immunogens or as non-toxic standards for the detection of neurotoxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Botulinum; recombinant; Clostridium botulinum; neurotoxin; immunogen;

Foster KA;

The present sequence represents a recombinant neurotoxin protein from the present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more vesicle or plasma-membrane associated proteins essential to exocytosis, and where the second domain is adapted:

(a) to translocate the protein into a cell; (b) to increase the solubility of the first domain into an into any or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the first domain on its own, the protein compared to the solubility of the protein capared to the solubility of the protein period into a cell and to first domain on its own, the protein compared to the solubility of the protein compared to the solubility of the protein compared to the solubility of the protein compared to the solubility of the protein compared to the solubility of the protein compared to the solubility of the protein can a forestiding near the recombinant proteins can be used as therapeutic can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of inventorial botulinum or tetanus neurotoxins either in foodstuffs or in environmental samples

Thalley BS;

96US-00704159 97WO-US015394

This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (NCTC 11219) type E neurotoxin, encoded by a DNA sequence (see AAV30585) in plasmid pETHisb. This vector is used to express BotE Soluble C fragment in Escherichia coli host cells, and the recombinant C fragment was purified on an affinity column. The invention relates to recombinant proteins derived from C. botulinum toxins, especially type B and type E toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin. Example 41; Page 327-329; 428pp; English N-PSDB; AAV30585 Sequence 452 AA;

Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.

Example 45; Page 339-341; 428pp; English

This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (Stockholm strain) type C1 neurotoxin, encoded by a DNA sequence (see AAV30588) in plasmid pETHisb. This vector is used to express BotC soluble C fragment in Escherichia coli host cells, and the recombinant C fragment was purified on an affinity column. The invention relates to recombinant proteins derived from C. botulinum toxins, especially type B and type E toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. coll, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin

Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.
                                                                                                                                  This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum seotype D neurotoxin, encoded by a DNA sequence (see AAV30591) in plasmid pETHisb. This vector can be used to express Botb soluble C fragment in Escherichia coli host cells, with the recombinant C fragment being purified on an affinity column. The invention relates to recombinant proteins derived from C botulinum toxins, especially type B and type E toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins useful in the treatment of humans and animals at risk of intoxication with clostridial toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antitoxin; vaccine; neurotoxin; toxin F; intoxication; immunogen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |--|

25-26; 24pp; English. CoJ Claim 8;

This sequence represents the light chain of BotFab 1, a murine recombinant antibody fragment (rFab) specific to botulinum toxin types A and B. A cDNA library was made from mouse mRNA isolated from mice immunised with human pentavalent toxid. The cloned mouse heavy and light chains were expressed in phage display libraries and screened for their ability to bind to botulinum toxin types A or B. The clones were then isolated and sequenced. Botulinum neurotoxin is produced as several antigenically distinct serotypes (A-G) and is non-covalently associated

-neurotoxic proteins that are found in neurotoxin complexes A and B. Such antibody fragments are able to act as immunosensors for detecting botulinum toxins in food and are also useful in health care and in military applications. They are less expensive to produce than monoclonal antibodies as they can be isolated from large scale bacterial cultures. Also, the affinity of an reab may be altered by mutagenesis of its gene and subsequent screening of the expressed reabs the non The rFab of this invention binds to non-neurotoxic proteins. with

Detection of botulinium toxin.

25-27; 24pp; English. Claim 8; Col

recombinant antibody fragment (FFab) specific to botulinum toxin types A and B. A cDNA library was made from mouse mRNA isolated from mice minumised with human pentavalent toxoid. The cloned mouse heavy and light chains were expressed in phage display libraries and screened for their ability to bind to botulinum toxin types A or B. The clones were then isolated and sequenced. Botulinum neurotoxin is produced as several antigenically distinct serotypes (A-G) and is non-covalently associated with non-neurotoxic proteins. The rFab of this invention binds to the non-neurotoxic proteins that are found in neurotoxin complexes A and B. Such antibody fragments are able to act as immunosensors for detecting This sequence represents the heavy chain of BotFab 1, a murine

Detection of botulinium toxin.

This sequence represents the light chain of BotFab 5, a murine recombinant antibody fragment (rFab) specific to botulinum toxin types A and B. A cDNA library was made from mouse mRNA isolated from mice immunised with human pentavalent toxoid. The cloned mouse heavy and light chains were expressed in phage display libraries and screened for their ability to bind to botulinum toxin types A or B. The clones were then

```
isolated and sequenced. Botulinum neurotoxin is produced as several antigenically distinct serctypes (A-G) and is non-covalently associated with non-neurotoxic proteins. The FRBD of this invention binds to the non-neurotoxic proteins that are found in neurotoxin complexes A and B. Such antibody fragments are able to act as immunosensors for detecting botulinum toxins in food and are also useful in health care and in military applications. They are less expensive to produce than monoclonal antibodies as they can be isolated from large scale bacterial cultures. Also, the affinity of an FRBD may be altered by mutagenesis of its gene and subsequent screening of the expressed rFabs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the heavy chain of BotFab 5, a murine recombinant antibody fragment (rFab) specific to botulinum toxin types A and B. A cDNA library was made from mouse mRNA isolated from mice immunised with human pentavalent toxoid. The cloned mouse heavy and light chains were expressed in phage display libraries and screened for their ability to bind to botulinum toxin types A or B. The clones were then isolated and sequenced. Botulinum neurotoxin is produced as several antigenically distinct serotypes (A-G) and is non-covalently associated with non-neurotoxic proteins. The rFab of this invention binds to the non

The present sequence represents a modified serotype C botulinum toxin, termed rBONT/C, in which amino acids His-229, Glu-230 and His-233 of the native sequence are substituted by Gly, Thr and Asn, respectively, i.e. the zinc binding motif (see AAVE0817) of the light chain holotoxin is modified, resulting in loss of endoprotease activity. DNA coding for the modified botulinum toxin (see AAXE5521) was assembled from 3 separate toxin fragments using PCR and site-directed mutagenesis. The modified recombinant botulinum toxin maintains its ability to translocate from the gut into the general circulation but is non-toxic. It can be used as an oral vaccine for antigenic peptides including botulinum toxin (i.e. an oral vaccine for botulism) or for the oral delivery of other therapeutic agents to the general circulation Modified toxin useful for systemic delivery of oral vaccines and therapeutic agents. | --| | NFTEAFAVTGVTILLEAFPEFTIPALGAFVIYSKVQERNEIIKTIDNCLEQRIKRWKDSY | 677 |--| | AFGGPTIDLIPKSARKYFEEKALDYYRSIAKRLNSITTANPSSFNKYIGEYKQKLIRKÝR | 330 AAY05814 Length: 1291 August 31, 2004 14:39 Type: P Check: 3136 Found using 'seq23' (hayes346.key) -| FVVESSGEVTVNRNKEVELYNELTQIFTEFNYAKIYNVQNRKIYLSNVYTPVTANILDDN 3333 380 GRFSKSEFCMDPILILMGTLNNAMHNLYGIAIPNDQTISSVTSNIFYSOYNVKLEYAEIY

Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (202F strain) type F neurotoxin, encoded by a DNA sequence (see AAV30593) in plasmid pETHisb. This vector can be used to express BotC soluble C fragment in Escherichia coli host cells, with the recombinant C fragment being purified on an affinity column. The invention relates to recombinant proteins derived from C. botulinum allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of significant proteins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin

Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin.

Example 49; Page 376-378; 428pp; English.

This is the amino acid sequence of the histidine-tagged C fragment of Clostridium botulinum (113/30 strain) type G neurotoxin, encoded by a DNA sequence (see AAV30596) in plasmid pETHisb. This vector can be used to express BotG soluble C fragment in Escherichia coli host cells, with the recombinant C fragment being purified on an affinity column. The invention relates to recombinant proteins derived from C. botulinum toxins, especially type B and type E toxins, methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin

Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A-G, is used for inducing an immune response against botulinum

Claim 26; Page 43-44; 54pp; English.

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment C DNA construct comprising a vector, and at least one nucleic acid fragment C ormprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-C c in preferred embodiments of the invention. The vector is a Venezuelan equine encephalitis virus (VEB) replicon vector. Use of this vector c sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of corrections these problems, as it is easily purified, and available in imminia reconness and any available in imminia reconness and any analyse contains corrected in the formulation contains contains contains in the interpretation and available in imminia reconness. Immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Horragments used in the present invention. The DNA encoding these sequences had been optimised for codon usage for expression in yeast

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BoNTA-BONTG). The vaccine of the invention is novel recombinant to the vaccine of the invention is novel recombinant comprising a vector, and at least one mucleic acid fragment comprising a c-terminal heavy chain fragment (Hc) from BoNT serotypes A-G. In preferred embodiments of the invention, the vector is a venezuelan equine encephalitis virus (WES) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of covercomes these problems, as it is easily purified, and available in a large quantities. It is also expressed in the lymph nodes for a better immune response. Sequences AAY77134-Y77139 represent synchetic BoNT Hc fragments used in the present invention. The DNA encoding these sequences that been optimised for codon usage for expression in yeast. Note: This sequence is not given in the specification, but is decoded from the BONTF WC Hc DNA sequence given on pages 45-46
                                                                                                                                                                                                                                                                                            Botulinum neurotoxin; heavy chain; BoNT; serotype F; C-terminal fragment; Venezuelan equine encephalitis virus replicon; VEE; botulism; vaccine; diagnosis; drug screening.

DNA construct Comprising a vector, and at least one nucleic acid fragment Comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-G. In preferred embodinents of the invention, the vector is a Venezuelan equine encephalitis virus (VEE) replicon vector luse of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used dayinst botulism is dangerous and cerpient. Also, the vaccine is incomplete, in that only 5 of the 7 cerpient. Also, the vaccine is incomplete, in that only 5 of the 7 certoryers are represented in the formulation. The novel vaccine of serotypes are represented in the formulation. The novel vaccine of large quantities. It is also expressed in the lymph nodes for a better immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc fragments used in the present invention. The DNA encoding these sequences had been optimised for codon usage for expression in yeast
      the invention is novel recombinant
      vaccine of

Botulinum neurotoxin vaccine comprising a fragment from botulinum serotypes A-G, is used for inducing an immune response against botulinum Novel

Example 3; Page 49; 54pp; English.

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BOMT) serotypes A, B, C, D, E, F and G (BOMTA-BONTG). The vaccine of the invention is novel recombinant C and G (BOMTA-BONTG). The vactor, and at least one mucleic acid fragment C DNA construct comprising a vector, and at least one mucleic acid fragment C C omprising a C-terminal heavy chain fragment (Hc) from BOMT serotypes A-G. In preferred embodiments of the invention, the vector is a venezuelan c quinne encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin collisions. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 covercomes these problems, as it is easily purified, on a variable in covercomes these problems, as it is easily purified, or a better covercomes these problems, as it is easily purified, or a better immune response. The present sequence represent invention

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BONT) serotypes A, B, C, D, E, F and G (BONTA-BONTG). The vaccine of the invention is novel recombinant to DNA construct comprising a vector, and at least one nucleic acid fragment comprising a vector, and at least one nucleic acid fragment comprising a vector. The vector is a venezuelan comprising of the invention, the vector is a venezuelan encephalitis virus (VEB) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce coused into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. The present sequence represents the native BoNTA heavy chain a resemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                       Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A-G, is used for inducing an immune response against

Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A-G, is used for inducing an immune response against

Smith L;

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BONTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-G. In preferred embodiments of the invention, the vector is a Venezuelan equine encephalitis virus (VEB) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism That transformed host cells can be effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and effective and contains formalin, which is very painful for the recipient. Also, the vaccine formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 covercomes these problems, as it is easily purified, and available in covercomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. The present sequence represents the native BONTA heavy contains in the lymph nodes for a better immune incomplete. invention

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BoNTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one mucleic acid fragment comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-C G. In preferred embodiments of the invention, the vector is a Venezuelan equine encephalitis virus (VEB) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic colls for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. The present sequence represented BONTA heavy chain C-terminal subfragment Asubfcl, comparising residues I to 233 of the BONTA terminal subfragment Asubfcl, comparising residues I.

The sequence represents a the C-terminus of the wildtype botulinum toxin trype A light chain. The invention relates to a novel modified neurotoxin including a structural modification, where the structural modification is effective to alter the biological persistence, or biological activity. The modified neurotoxin is useful for treating spasmodic dysphonia, laryngeal dystomia, oremadibular dysphonia, lingual dystomia, cervical spasm, evelid disorder, cerebral palsy, focal spasticity, spasmodic spasm, eyelid disorder, cerebral palsy, focal spasticity, spasmodic oblitis, neurogenic bladder, anismus, limb spasticity, tics, tremors, bruxism, anal fissure, achalasia, dysphagia, lacrimation, hyperhydrosis, excessive salivation, excessive gastrointestinal secretions, pain from muscle spasms, headache pain, brow furrows or skin wrinkles

serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium. Novel nucleic acid molecule encoding botulinum neurotoxin light chain serctype A, useful for producing the neurotoxin for vaccination agains

Claim 52; Page 118-119; 166pp; English.

The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is

useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystomias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cometic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and muscles common nerve function or tiptoe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin light chain serotype A protein Check: 9465 MVQFVNKQFNYKDPVNGVDIAYIKIPNVGQMQPVKAFKIHNKIWVIPERDTFTNPEEGDL INVIQPDGSYRSBELNLVIIGPSADIIQFECKSFGHEVLNLTRNGYGSTQYIRFSPDFTF GFEESLEVDTNPLLGAGKFATDPAVTLAHELIHAGHRLYGIAINPNRVFKVNTNAYYEMS |--| GLEVSFEELRTFGGHDAKFIDSLQENEFRLYYYNKFKDIASTLNKAKSIVGTTASLQYMK |--| NVFKEKYLLSEDTSGKFSVDKLKFDKLYKMLTELYTEDNFVKFFKVLNRKTYLNFDKAVF |--| KINIVPKVNYTIYDGFNLRNTNLAANFNGQNTEINNMNFTKLKNFTGLFEFYKLLCVRGI Type: P ABG69067 Length: 461 August 31, 2004 14:39 Found using 'seq23' (hayes346.key) 22 25 NPPPEAKQVPVSYYD Sequence 461 AA; 385 8 <del>X</del> G G G G G G G G G 136 196 256 316 376 61

The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclomus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin linhibitors. This sequence Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmetic treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; immunostimulant; antibacterial. Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium. Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.

74

```
The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dysfunesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiploe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmettic treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; immunostimulant; antibacterial.

```
The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, coular molility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segments myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiplo-e-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin linhibitors. This sequence
                                                                                                                                                                                                                                                                                                            Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ANKEKVKCRNTYFIKÝEFĽKVENLLDDDIYTVSEGFNIGNLAVNNRGQSIKLNPKIIDSP

```

The invention relates to a nucleic acid molecule encoding a botulinum that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoyT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and control automatic function or tiptoe-walking due to stiff. muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin light chain serotype A protein

Sequence 439 AA;

Smith LA,

The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serctype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff

muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin light chain serotype A protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |--|

nue inventibut traces to a nuttatic acts with the DNA has a sequence neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BONT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental mysclonus, hyperkinetic disorders, ocsmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff wuscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin light chain serotype A protein
                                                                                                                                                                    Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
                                                                                                                                                                                                                                                                                                                  The invention relates to a nucleic acid molecule encoding a botulinum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GFEESLEVDTNPLLGAGKFATDPAVTLAHELIHAGHRLYGIAINPNRVFKVNTNAYYEMS

```
The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BONT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BONT LC protein is useful in vaccination against botulism, for eliciting protective immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      spasticity; ocular motility; facial dyskinesis; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmetic treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; immunostimulant; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.

in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin light chain serotype A protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmettc treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; immunostimulant; antibacterial.

```
The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spassicity, pain, octiar motility, facial dystinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff to control autonomic nerve function or tiptoe-walking due to stiff useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
                                                                                                                                                                                         Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |--|

The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dystinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, control autonomic nerve function or tiptoe-walking due to stiff to control autonomic nerve function or tiptoe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder osometic treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; immunostimulant; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
